

Hypori is transforming secure mobility for Federal and Commercial customers. Our innovative virtual workspace solution enables secure, remote access to enterprise apps and data from any device, anywhere. From commercial IP to national security level intel, Hypori protects data from every type of threat with zero data at rest.

Hypori is simple & secure

Hypori's solution is a user-centric, SaaS delivered, single OS, virtual workspace that gives users the experience they expect, while keeping enterprise data and apps off the physical device. Zero-trust network architecture and encrypted pixel transmission deliver a separate, secure virtual workspace to any mobile device. With no data in transit and no data on the device, enterprise documents and tools never leave the cloud, and the personal device and corporate data exist in 100% separate environments.

Traditional mobile security is cumbersome & compromising

Government and enterprise organizations are challenged with protecting data, apps, and users without stifling innovation, delaying mobility rollouts, or compromising end-user adoption. Legacy MDM requires multi-OS solutions, investment in hardware, and securing the data at the source, in transit, and on the endpoint.

Eliminate risks associated with malware, reverse engineering, and theft. FISMA, HIPAA, NIAP, NSA CSfC, and PCI DSS compliant, and Common Criteria Certified.

Manage **single, centralized, mobile OS virtual environment** in the cloud. Develop and test apps without wrapping or modification.

SaaS delivery of Hypori app drives adoption, eliminates liability from big brother policies, and scales on-demand.
